Meeting 1:

1. The agenda of the meeting was to get an overview of the project, and get the rough estimate of the time and software requirements to complete the project.
2. The client explained that the work that is supposed to be done by the team, i.e to design an interactive UI and accurate plotting of the sound file(with emotions) that will be given to us. For that, the team needed to have an understanding of how the input(the sound file and information) will be given. The necessary was explained by the client.
3. He also briefly told us about what is expected to be made for the UI and the add-ons, but asked us to start with the core problem, i.e plotting the sound with the emodata as everything else depends on this.
4. The client said that he expected the coding to be done with an Open source software and that the application is a desktop application, supposed to run on 3 OS's, namely, Linux, Windows and Mac.
5. We were told to have a look at some open sources for reference.
6. The meeting ended with the team promising the client to be back with the core requirements to kick start the project.
